

# Supracondylar Humerus K-wire Planning Report

Generated: 20251122\_125416

Original AP radiograph (unprocessed).

## Cross – 2 wires

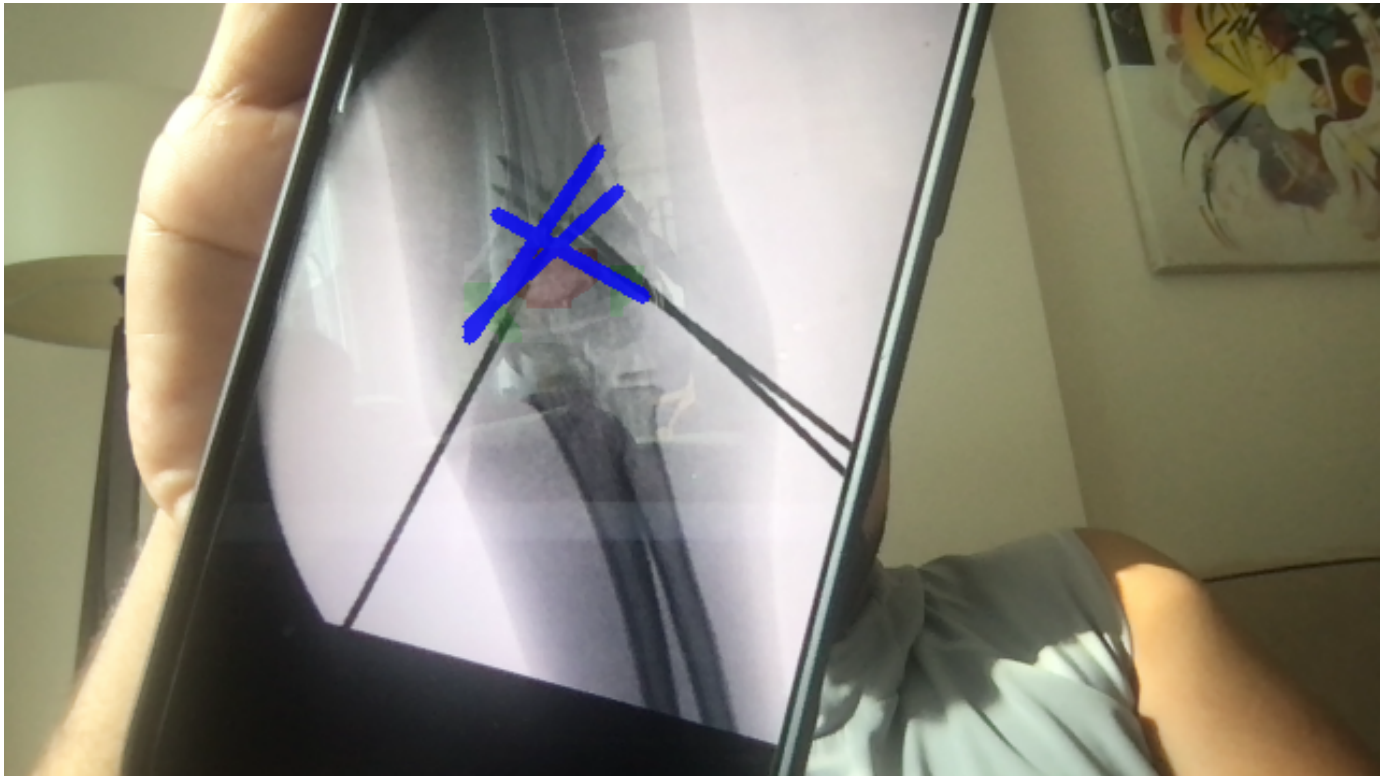

### Cross – 2 wires

- Divergence angle: 108.4°
- Entry spread (rel. humerus width): 0.71
- Crossing height (relative): 0.28

#### Pros:

- Good divergence ( $\geq 30^\circ$ ) – likely stable construct.
- Adequate lateral spread of entry points.

## Cross – 3 wires

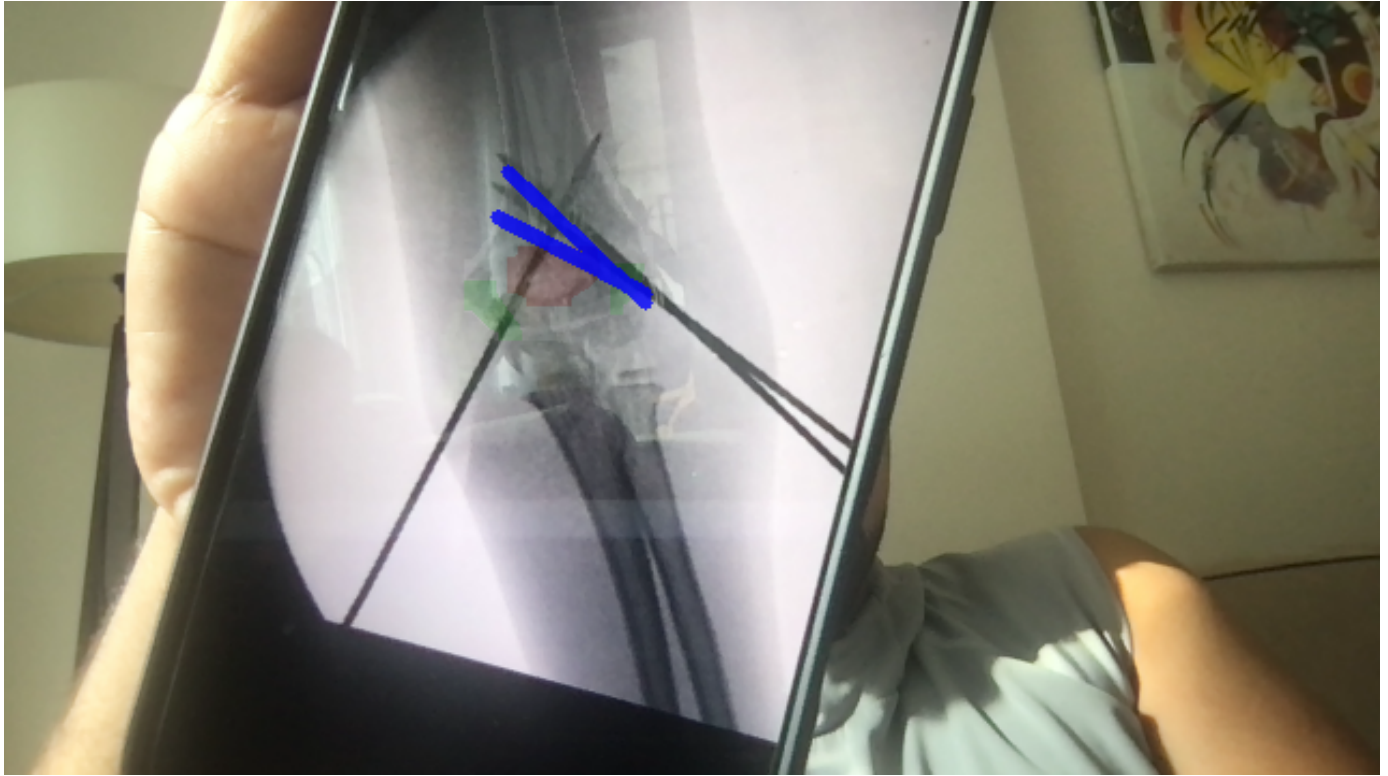

### Cross – 3 wires

- Divergence angle: 108.4°
- Entry spread (rel. humerus width): 0.71
- Crossing height (relative): 0.28

#### Pros:

- Good divergence ( $\geq 30^\circ$ ) – likely stable construct.
- Adequate lateral spread of entry points.

## Lateral – 2 wires

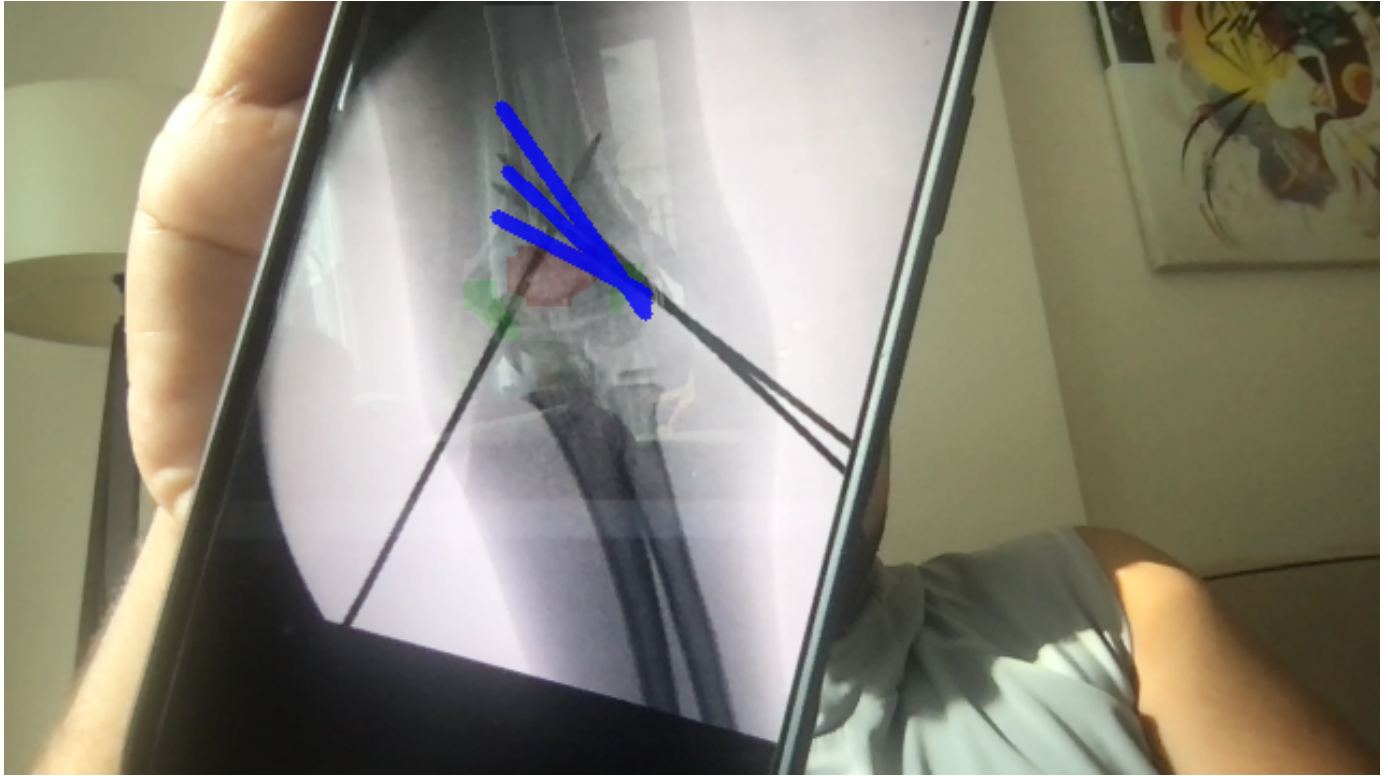

### Lateral – 2 wires

- Divergence angle: 16.1°
- Entry spread (rel. humerus width): 0.00
- Warnings: low\_divergence\_angle

#### Cons:

- Low divergence ( $<30^\circ$ ) – potential mechanical weakness.
- Narrow entry spread – reduced buttressing.

## Lateral – 3 wires

### Lateral – 3 wires

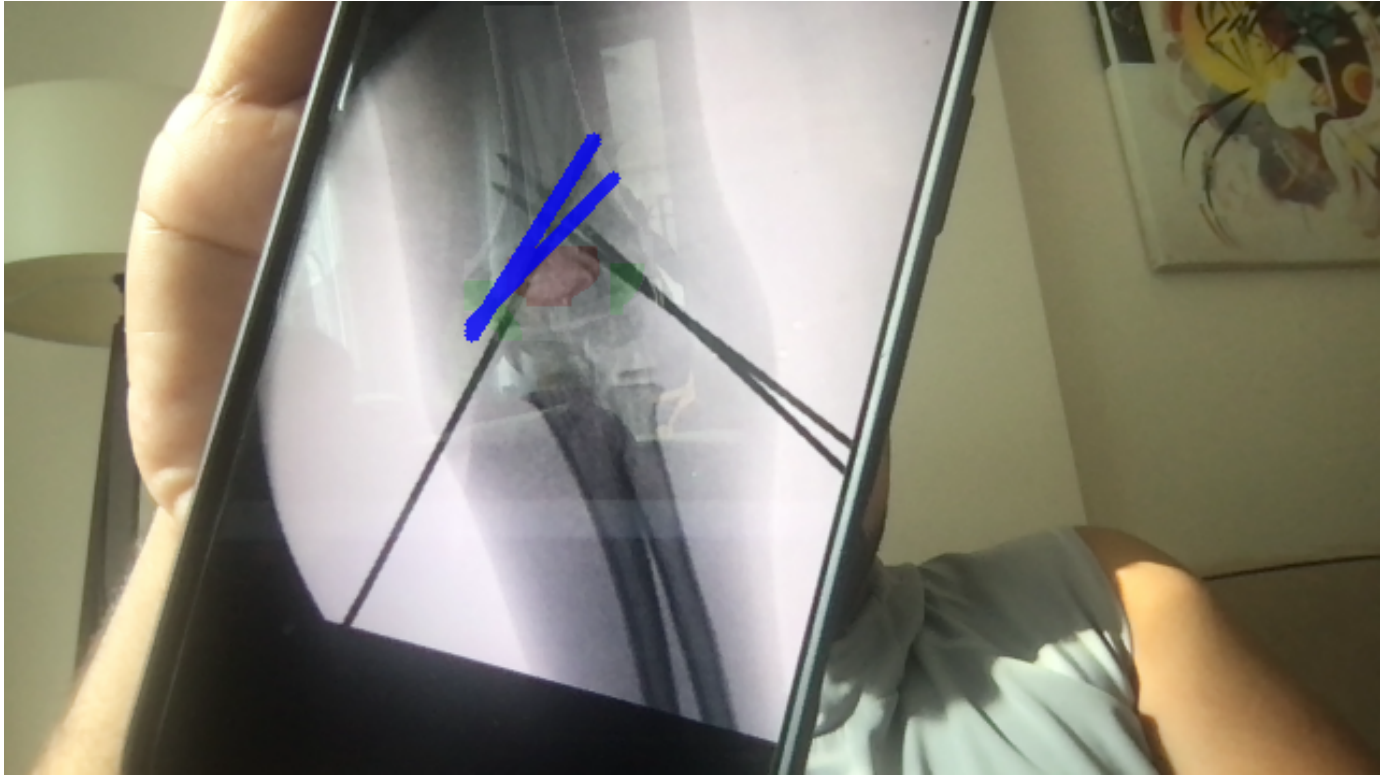

- Divergence angle: 16.1°
- Entry spread (rel. humerus width): 0.00
- Warnings: low\_divergence\_angle

#### Cons:

- Low divergence ( $<30^\circ$ ) – potential mechanical weakness.
- Narrow entry spread – reduced buttressing.

## Medial – 2 wires

### Medial – 2 wires

- Divergence angle: 12.1°
- Entry spread (rel. humerus width): 0.00
- Warnings: low\_divergence\_angle

#### Cons:

- Low divergence ( $<30^\circ$ ) – potential mechanical weakness.
- Narrow entry spread – reduced buttressing.

## Medial – 3 wires

### Medial – 3 wires

- Divergence angle: 12.1°
- Entry spread (rel. humerus width): 0.00
- Warnings: low\_divergence\_angle

#### Cons:

- Low divergence ( $<30^\circ$ ) – potential mechanical weakness.
- Narrow entry spread – reduced buttressing.
